Compressor and Pump Technology for Oil and Gas Operations

Ref: 103600567_106276 **Date:** 28 June – 2 July 2027 **Location:** Athens **Fees:** 7500 Euro

Course Overview:

This specialized training course provides a practical and in-depth understanding of compressor and pump technology within oil and gas operations. The course is designed to help technical teams improve equipment reliability, reduce downtime, optimize performance, and apply effective maintenance and troubleshooting methods across critical rotating equipment.

Participants will explore the operating principles, selection criteria, performance behavior, failure modes, and maintenance requirements of reciprocating, rotary, centrifugal, and dynamic compressors and pumps. The course also highlights real operational challenges such as cavitation, surge, vibration, leakage, seal failure, lubrication issues, overheating, poor efficiency, and abnormal pressure or flow behavior.

Through technical discussions, real-world oil and gas case studies, diagnostic exercises, and practical problem-solving sessions, participants will learn how to detect faults early, interpret performance data, apply predictive maintenance techniques, and make better decisions related to equipment sizing, operation, inspection, and reliability improvement.

This course is ideal for professionals responsible for operating, maintaining, inspecting, or improving compressors and pumps in demanding industrial environments.

Target Audience:

- Operation and Maintenance Operators
- Mechanical Technicians
- Maintenance Supervisors
- Facility Engineers
- Utility Engineers
- Reliability Engineers
- Integrity Engineers
- Rotating Equipment Technicians
- Condition Monitoring Professionals
- Oil and Gas Technical Staff

Targeted Organizational Departments:

- Operations
- Maintenance
- Engineering
- Reliability and Integrity Management
- Mechanical Maintenance
- Quality Control
- Asset Management
- Utilities and Facilities

Targeted Industries:

- Oil and Gas
- Petrochemical
- Refining
- Energy Production
- Utilities
- Manufacturing
- Power Generation
- Process Industries

Course Offerings:

Participants will be able to:

- Explain the working principles of compressors and pumps
- Identify different compressor and pump types and applications
- Select suitable equipment based on operating conditions
- Improve equipment efficiency, reliability, and lifecycle performance
- Detect common faults before failure occurs
- Analyze vibration, lubrication, pressure, flow, and temperature issues
- Apply preventive and predictive maintenance strategies
- Troubleshoot cavitation, surge, seal failure, overheating, and abnormal noise
- Reduce equipment downtime and maintenance cost
- Support safer and more reliable oil and gas operations

Training Methodology:

The training methodology combines technical instruction, real-world oil and gas case studies, equipment failure analysis, practical troubleshooting exercises, group discussions, and guided diagnostic activities. Participants will work through operational scenarios to connect theory with field application and develop practical decision-making skills for compressor and pump reliability.

Course Toolbox:

- Compressor and pump selection templates
- Fault diagnosis checklist
- Preventive and predictive maintenance checklist
- Vibration analysis examples
- Lubrication and oil analysis guidance
- Performance troubleshooting worksheets
- Case studies from oil and gas operations
- Maintenance planning examples

Course Agenda:

Day 1: Fundamentals of Compressors and Pumps in Oil & Gas Operations

- **Topic 1:** Role of Compressors and Pumps in Oil and Gas Facilities
- **Topic 2:** Basic Fluid Flow, Pressure, Temperature, and Gas Laws
- **Topic 3:** Classification of Compressors: Reciprocating, Rotary, Centrifugal, and Axial
- **Topic 4:** Classification of Pumps: Centrifugal, Positive Displacement, Gear, Screw, and Diaphragm Pumps
- **Topic 5:** Main Components, Operating Principles, and Performance Characteristics
- **Topic 6:** Key Applications in Upstream, Midstream, Downstream, and Utilities Operations
- **Reflection & Review:** Understanding equipment functions, applications, and operating principles

Day 2: Equipment Selection, Sizing, and Performance Evaluation

- **Topic 1:** Compressor Selection Criteria for Oil and Gas Applications
- **Topic 2:** Pump Selection Criteria Based on Flow, Head, Pressure, and Fluid Properties
- **Topic 3:** Understanding Compressor Curves and Pump Performance Curves
- **Topic 4:** Net Positive Suction Head, Cavitation Risk, and Suction System Design
- **Topic 5:** Efficiency, Capacity Control, Load Variation, and Energy Consumption
- **Topic 6:** Practical Sizing and Selection Mistakes That Cause Operational Problems
- **Reflection & Review:** Applying selection and performance principles to real operating conditions

Day 3: Maintenance, Inspection, and Reliability Improvement

- **Topic 1:** Preventive Maintenance Requirements for Compressors and Pumps
- **Topic 2:** Predictive Maintenance and Condition Monitoring Techniques
- **Topic 3:** Lubrication Management and Used Oil Analysis
- **Topic 4:** Mechanical Seals, Bearings, Couplings, and Alignment Practices
- **Topic 5:** Inspection Planning, Maintenance Intervals, and Shutdown Preparation
- **Topic 6:** Reliability Improvement Methods for Rotating Equipment
- **Reflection & Review:** Building effective maintenance strategies to reduce downtime

Day 4: Troubleshooting and Fault Detection Techniques

- **Topic 1:** Common Compressor Problems: Surge, Overheating, Vibration, Leakage, and Capacity Loss
- **Topic 2:** Common Pump Problems: Cavitation, Low Flow, Seal Failure, Noise, and Excessive Vibration
- **Topic 3:** Vibration Analysis for Fault Detection and Root Cause Identification
- **Topic 4:** Pressure, Flow, Temperature, and Power Consumption Diagnostics
- **Topic 5:** Failure Mode Analysis for Critical Compressor and Pump Components
- **Topic 6:** Practical Troubleshooting Case Studies from Oil and Gas Facilities
- **Reflection & Review:** Diagnosing faults and selecting corrective actions

Day 5: Optimization, Safety, and Practical Application

- **Topic 1:** Improving Compressor and Pump Efficiency in Continuous Operations
- **Topic 2:** Energy Optimization and Lifecycle Cost Reduction
- **Topic 3:** Safety Considerations in Compressor and Pump Operation
- **Topic 4:** Operational Risk, Reliability, and Integrity Management
- **Topic 5:** Emerging Technologies in Monitoring, Automation, and Digital Maintenance
- **Topic 6:** Final Practical Workshop: Developing an Equipment Reliability Action Plan
- **Reflection & Review:** Final review, lessons learned, and practical application plan

How This Course is Different:

This course is highly practical and designed specifically for oil and gas professionals who work with critical rotating equipment. Instead of focusing only on technical theory, it connects compressor and pump principles with real operational problems, maintenance decisions, troubleshooting methods, and reliability improvement practices.

Participants leave the course with practical checklists, diagnostic methods, selection criteria, and maintenance strategies they can apply directly in the field. The course supports safer operations, lower downtime, improved equipment performance, and better decision-making across operations, maintenance, and engineering teams.
