Tbilisi

Document Integrity and Control Essentials Training Course

Ref: 812_161525 **Date:** 29 March – 2 April 2027 **Location:** Tbilisi **Fees:** 5000 Euro

Overview

Document Integrity and Control Essentials Training Course is a five-day foundation course for document controllers, records coordinators, data stewards, quality teams, administrators, and operational staff who leave with a Document Integrity Control File. Participants apply document metadata, version control, approval workflow, access control, retention, validation, change history, and audit evidence to daily document control. The course turns incomplete records and uncontrolled changes into traceable handling decisions. Agile Leaders Training Center develops practical document integrity and control capability.

Who Should Attend

- Document control functions responsible for identification, registration, version status, distribution, and retrieval
- Records coordination functions responsible for metadata, retention triggers, transfers, and disposition evidence
- Data stewardship functions responsible for completeness, consistency, validation, and issue resolution
- Quality functions responsible for review, approval, controlled change, and audit evidence
- Administrative and operational functions responsible for creating, receiving, updating, and handing over documents

The course assumes participants already handle workplace documents and basic records, and leaves out system configuration, archive administration, technical writing, and enterprise data governance.

Departments and Industries

The course supports departments and industries that depend on reliable documents, controlled changes, and retrievable evidence.

- Administration, document control, records coordination, quality, compliance, and internal audit departments
- Engineering, construction, manufacturing, energy, and utilities operations
- Healthcare, education, research, and professional services
- Banking, insurance, procurement, logistics, and customer-service operations

Learning Objectives

By the end of this course, participants will be able to:

- Apply identification, naming, metadata, and document-status controls
- Use version control and approval workflow records
- Build access, retention, retrieval, and handover registers
- Analyze missing, duplicate, conflicting, and unauthorized document changes
- Evaluate audit trails, validation evidence, exceptions, and corrections
- Build a Document Integrity Control File for daily use

Course Agenda

Day 1: Identify and Register Documents

- Document Purpose, Owner, and Identifier Card
- Naming Convention and File-Structure Guide
- Core Metadata and Context Register
- Source, Format, and Completeness Check
- Controlled Document Inventory and Status List

Day 2: Control Versions and Approvals

- Draft, Review, Approval, and Release Workflow
- Version Number and Revision-Status Rule
- Change Request and Impact Record
- Reviewer and Approver Responsibility Matrix
- Superseded Copy and Distribution Control Log

Day 3: Protect Access and Retention

- Role-Based Access and Permission Register
- Authorized Change and Attribution Checklist
- Retention Trigger and Disposition Reference Map
- Retrieval, Checkout, and Return Log
- Transfer and Handover Completeness Checklist

Day 4: Validate Integrity and Evidence

- Document Validation and Reconciliation Checklist
- Missing, Duplicate, and Conflicting Record Issue Log
- Audit-Trail Event Review Sheet
- Exception, Correction, and Escalation Workflow
- Document Integrity Indicator and Review Dashboard

Day 5: Practice Document Integrity Control

- Exercise: Register and Classify a Document Set
- Exercise: Correct Version and Approval Breakdowns
- Exercise: Test Access, Retention, and Handover Evidence
- Exercise: Review Audit-Trail and Integrity Exceptions
- Capstone: Document Integrity Control File

Practical Exercises

The course uses suggested activities based on engineering, healthcare, financial-service, and administrative document scenarios.

- Suggested activity: register a mixed document set, assign identifiers and metadata, and record its current status.
- Suggested activity: investigate conflicting versions, reconstruct approval decisions, and control superseded copies.
- Suggested activity: test access, retention, retrieval, transfer, and handover evidence for an operational file.
- Suggested activity: review audit-trail events, log integrity exceptions, and assemble corrective evidence.

FAQs

Who suits document integrity and control training, and what does it assume?

Document control, records coordination, data stewardship, quality, administration, and operational functions suit the training; it assumes participants already create, receive, update, retrieve, or hand over workplace documents.

How does document integrity and control training differ from electronic document system configuration?

Document integrity and control training develops daily identification, metadata, version, approval, access, validation, and evidence practices, while system configuration focuses on technical setup, platform rules, and application administration.

What information belongs in document metadata?

Document metadata records identity, title, owner, source, status, version, dates, classification, access, retention, relationships, and handling context needed to find, interpret, and control a document.

How is version control connected to document integrity?

Version control preserves the approved state, identifies authorized changes, separates current and superseded copies, links reviewers and approvers, and provides a traceable history of what changed and why.

What evidence supports a document integrity review?

Document integrity review uses inventories, metadata, version histories, approval records, access logs, change histories, validation results, issue logs, retention decisions, audit trails, and handover checks.

Conclusion

Participants take back a Document Integrity Control File containing identification, metadata, version, approval, access, retention, validation, issue, audit-trail, and handover records. It changes informal document handling into traceable daily controls. The file connects document status, authorized action, retained evidence, exceptions, and corrective follow-up.
