Excel Data Management and Reproducible Analysis Training Course

Ref: 813_161593 **Date:** 18 – 22 January 2027 **Location:** Tokyo **Fees:** 10000 Euro

Overview

Excel Data Management and Reproducible Analysis Training Course is a five-day foundation course for analysts, coordinators, administrators, and operational professionals who leave with a Refreshable Excel Analysis Workbook. Participants apply Excel data management, data cleaning, data validation, Power Query transformations, formula controls, reconciliation, and PivotTable analysis to structured business data. The course turns fragile manual files into traceable preparation and refresh routines. Agile Leaders Training Center develops practical Excel data management and analysis capability.

Who Should Attend

- Analysis functions responsible for preparing source data and producing recurring summaries
- Administrative functions responsible for maintaining operational lists, registers, and trackers
- Coordination functions responsible for consolidating files and checking submitted data
- Operations functions responsible for monitoring transactions, service records, or performance data
- Reporting functions responsible for refreshable tables, reconciliations, and management views

The course assumes participants can enter data and use basic worksheets, and leaves out macros, advanced financial modeling, database administration, data science, and Power BI development.

Departments and Industries

The course supports departments and industries that manage recurring structured data and need reliable analysis.

- Finance, administration, procurement, human resources, and reporting departments
- Manufacturing, logistics, retail, hospitality, and customer-service operations
- Healthcare, education, research, and professional services
- Engineering, construction, energy, and facilities operations

Learning Objectives

By the end of this course, participants will be able to:

- Apply table structures, field definitions, and naming controls
- Use validation rules and quality checks for consistent entries
- Build formulas for cleaning, matching, classification, and exception detection
- Analyze and transform source data with Power Query
- Evaluate reconciliations, refresh results, and PivotTable summaries

- Build a Refreshable Excel Analysis Workbook with control evidence

Course Agenda

Day 1: Structure Managed Excel Data

- Source and Field Inventory Worksheet
- Excel Table Structure and Header Standard
- Data-Type and Format Control Guide
- Field Definition and Naming Dictionary
- Workbook Layout and Version Register

Day 2: Clean and Validate Entries

- Missing-Value and Completeness Check
- Duplicate Detection and Resolution Log
- Text, Date, and Number Cleaning Formula Set
- Data Validation Rule and Input-Message Design
- Data Quality Exception Register

Day 3: Manipulate and Reconcile Data

- Lookup and Matching Formula Pattern
- Conditional Classification and Flagging Logic
- Multi-Sheet Consolidation Control
- Source-to-Output Reconciliation Worksheet
- Formula Error and Dependency Review Checklist

Day 4: Transform and Analyze Data

- Power Query Source Connection Map
- Power Query Applied-Steps Transformation Log
- Merge, Append, Pivot, and Unpivot Method
- Refresh and Schema-Change Check
- PivotTable Summary and Filter Design

Day 5: Practice Reproducible Excel Analysis

- Exercise: Structure and Validate a Source Table
- Exercise: Clean, Match, and Reconcile Business Records
- Exercise: Build and Refresh a Power Query Flow
- Exercise: Evaluate PivotTable Results and Exceptions
- Capstone: Refreshable Excel Analysis Workbook

Practical Exercises

The course uses suggested activities based on finance, logistics, healthcare, and service-operation datasets.

- Suggested activity: restructure an inconsistent source file into a controlled Excel table with field definitions and validation rules.
- Suggested activity: detect missing, duplicate, mismatched, and incorrectly formatted records and document the corrections.
- Suggested activity: combine recurring files through Power Query, reconcile row and value totals, and test refresh behavior.
- Suggested activity: create PivotTable summaries, trace exceptions, and package the workbook for repeatable use.

FAQs

Who suits Excel data management training, and what does it assume?

Analysts, administrators, coordinators, reporting functions, and operational teams suit the training; it assumes participants can enter data, navigate worksheets, and use basic formulas.

How does Excel data management differ from advanced Excel training?

Excel data management centers on structured data, quality controls, repeatable transformations, reconciliation, and refresh evidence, while advanced Excel training usually covers a wider range of functions, automation, and modeling features.

How does data validation improve Excel data quality?

Data validation restricts permitted entries, guides users with input messages, identifies invalid values, and supports consistent field rules before records enter later calculations and summaries.

Why use Power Query transformations for recurring Excel files?

Power Query transformations record repeatable connection and preparation steps, allowing the same logic to be refreshed when source files change while retaining a visible sequence of applied actions.

What makes Excel analysis reproducible?

Reproducible Excel analysis uses documented sources, stable table structures, controlled formulas, saved transformation steps, reconciled totals, refresh checks, exception records, and defined outputs that another authorized user can repeat.

Conclusion

Participants take back a Refreshable Excel Analysis Workbook containing data definitions, table controls, validation, cleaning formulas, Power Query steps, reconciliation, exceptions, and PivotTable summaries. It changes one-off spreadsheet handling into a repeatable analysis routine. The workbook connects source data, transformations, checks, outputs, and refresh evidence.
