Blockchain for Energy Management Training Course

Ref: 882_166639 **Date:** 8 – 12 February 2027 **Location:** Lisbon **Fees:** 5700 Euro

Overview

Blockchain for Energy Management Training Course is a one-week course for energy managers, utility professionals, transformation leaders, and sustainability teams who leave with an Energy Blockchain Implementation Pack. Participants evaluate distributed ledgers for peer-to-peer energy trading, renewable energy certificates, grid data integrity, smart contracts, and asset traceability. The course connects business value, architecture, cybersecurity, governance, regulatory readiness, and phased delivery. Agile Leaders Training Center develops blockchain for energy management practice.

Who Should Attend

- Energy functions responsible for efficiency, trading, renewable integration, and performance
- Utility functions responsible for grid operations, metering, distributed resources, and customer services
- Digital functions responsible for platforms, architecture, data, and transformation portfolios
- Sustainability functions responsible for renewable claims, certificates, traceability, and reporting
- Risk functions responsible for cybersecurity, controls, governance, and regulatory readiness

The course assumes participants already assess energy operations or digital initiatives; it leaves out software coding, cryptocurrency trading, and platform certification.

Departments and Industries

The course supports departments and industries designing governed digital-energy services.

- Electricity generation, transmission, distribution, retail, and energy services
- Renewable developers, storage operators, microgrids, and energy communities
- Oil, gas, manufacturing, logistics, buildings, and industrial facilities
- Finance, insurance, technology, consulting, and assurance functions
- Strategy, sustainability, innovation, cybersecurity, and enterprise architecture

Learning Objectives

By the end of this course, participants will be able to:

- Compare blockchain patterns with conventional energy data architectures.
- Analyze peer-to-peer trading and renewable certificate use cases.
- Build smart contract, oracle, identity, and permission models.
- Evaluate cybersecurity, privacy, governance, and regulatory risks.
- Prioritize use cases through value, feasibility, and readiness evidence.
- Build an Energy Blockchain Implementation Pack.

Course Agenda

Day 1: Frame Energy Blockchain Decisions

- NIST Blockchain Component and Consensus Map
- Energy Value Chain and Stakeholder Canvas
- Centralized versus Distributed Architecture Matrix
- Blockchain Suitability Decision Tree
- Energy Use-Case Value Hypothesis

Day 2: Design Trading and Traceability Use Cases

- Peer-to-Peer Energy Trading Process Map
- Transactive Energy Market Role Model
- Renewable Energy Certificate Lifecycle Map
- Guarantee-of-Origin Traceability Chain
- Distributed Energy Resource Registration Model

Day 3: Build the Solution Architecture

- Permissioned Network Governance Blueprint
- Smart Contract Rule and Exception Table
- Metering Data Oracle Trust Model
- Identity, Key, and Access Control Matrix
- Grid-System Integration Interface Map

Day 4: Govern Risk and Delivery

- Blockchain Cybersecurity Threat Model
- Data Privacy and Retention Control Map
- Regulatory Readiness Assessment
- Vendor and Platform Evaluation Scorecard
- Proof-of-Concept Stage-Gate Roadmap

Day 5: Practice Energy Blockchain Implementation

- Exercise: Screen an Energy Use Case
- Exercise: Model a Certificate Traceability Flow
- Exercise: Diagnose a Smart Contract Control Gap
- Exercise: Prioritize a Blockchain Delivery Portfolio
- Capstone: Energy Blockchain Implementation Pack

Practical Exercises

The course uses suggested activities based on utility, renewable energy, industrial, and building-energy cases.

- Suggested activity: test whether a multi-party energy process needs a shared ledger.
- Suggested activity: map meter data, certificates, identities, permissions, and settlement rules.
- Suggested activity: assess cybersecurity, governance, regulatory, and operating-model controls.
- Suggested activity: defend a phased proof-of-concept and implementation roadmap.

FAQs

Who suits blockchain for energy management training, and what does it assume?

Energy, utility, digital, sustainability, architecture, and risk functions suit the training. It assumes experience assessing operations or technology initiatives and requires no coding background.

How does blockchain for energy management differ from cryptocurrency training?

Blockchain for energy management focuses on shared records, energy trading, certificate traceability, grid data, controls, and implementation, while cryptocurrency training focuses on digital assets, wallets, exchanges, and market operations.

When is blockchain suitable for an energy process?

Blockchain is suitable when independent parties need a shared, tamper-evident record, coordinated rules, traceability, and reduced reconciliation, and when those benefits justify governance and integration complexity.

How can smart contracts support energy management?

Smart contracts can apply agreed rules to metering inputs, eligibility checks, certificate transfers, settlement events, and exceptions when trusted data, permissions, testing, and human oversight are defined.

What risks affect blockchain energy projects?

Blockchain energy projects face key-management, smart-contract, oracle, privacy, interoperability, scalability, vendor, regulatory, and operating-model risks that require assigned controls and monitoring.

Conclusion

Participants take back an Energy Blockchain Implementation Pack containing use-case screens, process maps, architecture views, control assessments, scorecards, and a phased roadmap. It changes isolated technology proposals into evidence-based energy decisions. The pack supports governed experimentation, traceable design choices, and practical delivery planning.
