AI-Assisted Energy Transition Strategy and Delivery Course

Ref: 270_223488 **Date:** 19 – 23 April 2027 **Location:** Addis Ababa **Fees:** 4500 Euro

Overview

AI-Assisted Energy Transition Strategy and Delivery Course is a one-week foundation course for energy strategy leaders, sustainability managers, utilities professionals, project sponsors, policy teams, and transition analysts, who leave with an AI-Assisted Energy Transition Strategy and Delivery Roadmap. Participants connect demand, supply, grid, asset, emissions, technology, investment, and policy evidence; compare pathway scenarios; prioritize initiatives; define governance; and organize accountable delivery. Agile Leaders Training Center provides training in AI-assisted energy transition strategy and delivery.

Who Should Attend

- Strategy teams responsible for energy-transition direction and priorities
- Sustainability teams responsible for emissions pathways and outcome measures
- Utility teams responsible for system evidence and transition initiatives
- Project sponsors responsible for investment choices and delivery oversight
- Policy teams responsible for transition options and stakeholder effects
- Analysts responsible for scenarios, evidence, and decision support

The course assumes participants contribute to energy, sustainability, policy, investment, or project decisions and leaves out technical power-system modeling, equipment design, software development, and energy-efficiency operations.

Departments and Industries

The course supports evidence-based energy-transition decisions across public and private organizations.

- Corporate strategy and sustainability functions
- Energy policy and public-sector planning teams
- Electric utilities and renewable energy organizations
- Oil, gas, and industrial transition functions
- Infrastructure investment and project delivery teams
- Transport, buildings, and manufacturing organizations

Learning Objectives

By the end of this course, participants will be able to:

- Apply AI-assisted evidence mapping to energy-transition choices
- Analyze demand, supply, grid, asset, emissions, and policy signals
- Compare pathway scenarios and document assumptions
- Prioritize transition initiatives through portfolio criteria
- Build governance roles, workstreams, and outcome measures
- Evaluate delivery progress and revise the transition roadmap

Course Agenda

Day 1: Transition Evidence and Scope

- Energy Transition Decision-Scope Canvas
- Demand and Supply Evidence Map
- Grid and Asset Signal Register
- Emissions and Technology Baseline Sheet
- Policy, Investment, and Stakeholder Context Map

Day 2: AI-Assisted Analysis and Scenarios

- AI Use-Case Selection Matrix
- Data Provenance and Quality Checklist
- Pathway Assumption Register
- Energy Scenario Comparison Table
- Uncertainty and Sensitivity Review

Day 3: Initiative and Portfolio Choices

- Transition Initiative Design Card
- Renewable Integration Option Screen
- Abatement, Cost, and Feasibility Matrix
- Transition Portfolio Prioritization Grid
- Dependency and Sequencing Map

Day 4: Governance and Delivery

- Responsible AI Oversight Checklist
- Transition Governance and Decision-Rights Matrix
- Workstream, Owner, and Milestone Plan
- Outcome Measure and Indicator Scorecard
- Monitoring, Learning, and Adaptation Cycle

Day 5: Energy Transition Strategy Practice

- Suggested Exercise: Build the Transition Evidence Map
- Suggested Exercise: Compare Pathway Scenarios
- Suggested Exercise: Prioritize the Initiative Portfolio
- Suggested Exercise: Assign Governance and Delivery Controls
- Capstone Exercise: AI-Assisted Energy Transition Strategy and Delivery Roadmap

Practical Exercises

The course uses suggested activities that convert energy-transition evidence into traceable strategy and delivery choices.

- Suggested activity: map demand, supply, grid, asset, emissions, technology, investment, and policy evidence for a utility or industrial case
- Suggested activity: compare pathway scenarios, assumptions, uncertainty, and stakeholder effects
- Suggested activity: screen renewable, infrastructure, and operational initiatives and prioritize a transition portfolio
- Suggested activity: assign decision rights, owners, milestones, outcome measures, and adaptation triggers

FAQs

Who suits AI-assisted energy transition strategy training?

AI-assisted energy transition strategy training suits strategy, sustainability, utility, policy, investment, project, and analysis teams. It assumes participants contribute to organizational decisions and requires no programming or technical power-system modeling.

How does AI-assisted energy transition strategy differ from energy-efficiency training?

AI-assisted energy transition strategy connects system pathways, portfolios, governance, investment, and delivery across multiple energy sources. Energy-efficiency training concentrates on reducing energy use in operations, buildings, or equipment.

How can AI support energy transition scenarios?

AI can support energy transition scenarios by organizing evidence, identifying patterns, comparing assumptions, testing sensitivities, and monitoring indicators. Human owners remain responsible for context, uncertainty, judgment, and decisions.

What belongs in an energy transition initiative portfolio?

An energy transition initiative portfolio contains defined initiatives, expected outcomes, dependencies, costs, feasibility criteria, risks, timing, owners, milestones, and measures used to prioritize, sequence, monitor, and adapt delivery.

What is an AI-Assisted Energy Transition Strategy and Delivery Roadmap?

An AI-Assisted Energy Transition Strategy and Delivery Roadmap connects the evidence base, pathway choice, initiative portfolio, governance roles, workstreams, milestones, outcome measures, and review triggers in one decision record.

Conclusion

Participants take back an AI-Assisted Energy Transition Strategy and Delivery Roadmap connecting evidence, scenarios, priorities, governance, and execution. The roadmap makes assumptions, choices, ownership, milestones, and outcome measures visible across functions. It supports traceable transition decisions, coordinated workstreams, and timely adaptation as evidence changes.
