Mechanical Seal and Gland Packing Application Training Course

Ref: 1882_240380 **Date:** 28 March – 1 April 2027 **Location:** Johannesburg **Fees:** 6000 Euro

Overview

Mechanical Seal and Gland Packing Application Training Course is a one-week intermediate programme for rotating-equipment, maintenance, reliability, inspection, and project personnel who leave with a Seal Application Review Pack. Participants connect service conditions, seal chambers, face and secondary-seal materials, configurations, arrangements, support systems, gland packing, installation evidence, leakage, and failure patterns with documented application decisions. The course develops purchaser and user review capability without replacing seal-vendor design, competent installation, or site authorization. Agile Leaders Training Center delivers this focused sealing-systems course.

Who Should Attend

- Mechanical and rotating-equipment engineers who review seal applications
- Maintenance and reliability personnel responsible for pumps and sealing systems
- Inspection and quality staff who examine seal documentation and installation evidence
- Project and procurement personnel who coordinate pump and seal packages
- Operations personnel who monitor leakage, temperature, pressure, and support systems

Participants should understand basic pump components and operating data. The course does not authorize pressure-boundary design, seal manufacture, intrusive work, or changes outside approved procedures.

Departments and Industries

The course supports petroleum, chemical, utilities, water, manufacturing, and other industries that operate centrifugal or rotary pumps.

- Mechanical engineering and rotating equipment
- Maintenance, reliability, and condition monitoring
- Inspection, quality, and technical assurance
- Projects, procurement, and vendor coordination
- Operations and process support

Learning Objectives

By the end of this course, participants will be able to:

AGILE LEADERS
Training Center

- Explain mechanical-seal and gland-packing operating principles
- Organize service data and seal-chamber information for application review
- Compare seal types, arrangements, materials, and support-system functions
- Evaluate gland packing selection, installation, adjustment, and operating evidence
- Interpret leakage, wear, heat, vibration, and contamination evidence
- Build a traceable seal application and failure-review record

Course Agenda

Day 1: Sealing Principles and Service Definition

- Leakage Path, Pressure Boundary, and Shaft-Motion Map
- Mechanical Seal, Lip Seal, and Gland Packing Comparison
- Process Fluid, Pressure, Temperature, Speed, and Hazard Data Register
- Seal Chamber, Shaft, Sleeve, and Runout Information Checklist
- Application Responsibility and Competence-Boundary Matrix

Day 2: Mechanical Seal Components and Arrangements

- Primary Face, Mating Face, Springs, Bellows, and Drive Mechanism Map
- Secondary Seals, Gaskets, Sleeve, and Gland Review
- Seal Type, Orientation, and Arrangement Comparison
- Balanced and Unbalanced Seal Behaviour
- Cartridge Assembly and Equipment-Interface Drawing Review

Day 3: Materials, Environment, and Support Systems

- Face-Material and Secondary-Seal Compatibility Matrix
- Lubrication Film, Heat Generation, and Distortion Concept Map
- Flush, Quench, Buffer, and Barrier Function Review
- Reservoir, Cooler, Separator, Instrument, and Piping Checklist
- Support-System Operating Limit and Alarm Register

Day 4: Gland Packing Selection and Application

- Packing Fibre, Binder, Lubricant, and Service Compatibility
- Stuffing Box, Shaft Sleeve, Lantern Ring, and Gland Geometry Review
- Packing Ring Preparation and Staggered-Joint Installation Sequence
- Gland Adjustment, Controlled Leakage, Temperature, and Run-In Checks
- Packing Wear, Sleeve Damage, Scoring, and Extrusion Evidence

Day 5: Failure Evidence and Application Review

- Leakage, Face Wear, Coking, Blistering, and Chemical Attack Matrix
- Dry Running, Misalignment, Vibration, Pressure, and Temperature Evidence
- Seal Support-System Deviation and Contamination Review
- Data Sheet, Drawing, Bill of Material, and Inspection Record Checklist
- Capstone Exercise: Seal Application Review Pack

Practical Exercises

Guided exercises turn service and failure evidence into documented review decisions.

- Build a service-condition register from a pump case
- Compare candidate seal arrangements and materials
- Trace the function of a seal support system
- Review a gland-packing installation and adjustment record
- Prepare a failure-evidence and escalation report

FAQs

Does the course teach seal-vendor design?

No. It develops application, documentation, and review literacy while detailed design and suitability confirmation remain with authorized engineering and vendor functions.

Are both mechanical seals and gland packing covered?

Yes. Participants compare their functions, selection factors, installation evidence, operating behaviour, leakage expectations, and failure signs.

Does the course address seal support systems?

Yes. It reviews the purposes of flush, quench, buffer, barrier, cooling, separation, instrumentation, and associated piping without authorizing field modification.

What failure evidence is examined?

Examples include leakage, wear patterns, heat, dry running, contamination, chemical attack, vibration, misalignment, scoring, and support-system deviations.

What will participants take back to work?

A Seal Application Review Pack containing service data, selection comparisons, support-system checks, packing records, inspection evidence, and an escalation template.

AGILE LEADERS
Training Center

Conclusion

Participants return able to review sealing applications, question documentation, recognize adverse evidence, and communicate safely with pump, seal, maintenance, and vendor specialists.
