ISGOTT 6 Training Course: Oil Tanker and Marine Terminal Safety

Ref: 2221_262442 **Date:** 13 – 17 September 2027 **Location:** Tokyo **Fees:** 12000 Euro

Overview

ISGOTT 6 Training Course: Oil Tanker and Marine Terminal Safety is a one-week course for terminal supervisors, marine loading masters, tanker deck officers, and safety superintendents who require an operational Ship/Shore Safety Checklist execution framework. Misaligned safety protocols between tankers and marine berths create severe fire, toxic exposure, and environmental pollution risks during bulk liquid transfers. This course addresses joint operational hazards through systematic interface controls, atmosphere monitoring standards, and standardized verification workflows. Agile Leaders Training Center delivers this course to align marine oil operations with current ISGOTT 6 guidelines.

Who Should Attend

- Marine loading masters supervising berth allocations, cargo arm alignments, and terminal transfer operations.
- Tanker chief officers and deck officers managing cargo handling, ballasting, and vapor control systems.
- Terminal operations superintendents coordinating oil transfer readiness and emergency response protocols.
- Marine terminal safety officers enforcing statutory permits, enclosed space entry, and berth safety audits.
- Port operations coordinators overseeing tanker berthing, mooring integrity, and bunkering safety clearances.

The course assumes participants actively manage bulk hydrocarbon marine operations and excludes statutory seafarer certification licensing.

Departments and Industries

The course supports technical teams and operational units across multiple industrial sectors.

- Marine Terminal Operations and Port Authorities
- Crude Oil and Refined Petroleum Refining
- Commercial Maritime Shipping and Fleet Management
- Offshore Logistics and Hydrocarbon Storage Terminals
- Health, Safety, and Environmental Risk Compliance

Learning Objectives

By the end of this course, participants will be able to:

- Apply ISGOTT 6 standards to align oil tanker and marine terminal transfer operations.
- Evaluate Ship/Shore Safety Checklist agreements, repetitive verification cycles, and human factors.
- Analyze atmospheric hazards involving hydrogen sulfide, benzene exposure limits, and oxygen concentration controls.
- Diagnose electrostatic discharge, stray current, and berth electrical isolation risks across manifold connections.
- Prioritize mooring line tensions using OCIMF Mooring Equipment Guidelines criteria during transfer cycles.
- Build a joint tanker-terminal emergency response protocol for cargo leaks and fire incidents.

FAQs

Who should attend the ISGOTT 6 Training Course: Oil Tanker and Marine Terminal Safety?

The course suits tanker officers, marine terminal superintendents, and loading masters coordinating bulk oil transfers. The course assumes foundational operational knowledge of marine hydrocarbon handling and focuses directly on ISGOTT 6 safety interface standards rather than basic seamanship.

How does this ISGOTT 6 course differ from cargo operations training?

This course concentrates specifically on the ship/shore interface, joint safety management, and terminal risk controls defined by ISGOTT 6. Dedicated cargo operations courses focus primarily on vessel trim, internal piping configurations, and voyage tank management rather than joint berth-vessel alignment.

What is the role of the Ship/Shore Safety Checklist in ISGOTT 6?

The Ship/Shore Safety Checklist establishes mandatory joint safety verifications between vessel officers and terminal representatives. ISGOTT 6 reinforces this tool with explicit repetitive checks, structured physical inspections, and formal tracking of human factors to ensure operational safety throughout transfers.

How does ISGOTT 6 address static electricity hazards?

ISGOTT 6 establishes strict transfer velocity limits, tank settling times, and non-conductive hose requirements. It eliminates reliance on ship-to-shore bonding cables, mandating insulating flanges or non-conductive hoses to prevent electrical arcing from stray currents during manifold connections.

Conclusion

Participants leave with a completed Joint Ship/Shore Safety Implementation Protocol tailored to their operational berths. This practical work product standardizes repetitive safety checks and eliminates alignment gaps between vessel crews and marine terminal personnel. Applying these tools mitigates toxic vapor releases, structural mooring failures, and catastrophic hydrocarbon ignition incidents.
